

## **RE: Hydro Seeding**

Dear Customer,

We recently came to your property and completed hydro-seeding.

Hydro Seeding in the high county a challenging task that requires lots of constant watering and weeding to ensure germination. The soil needs to stay moist for the seeds to germinate, so this area must be watered frequently. If watered properly, your seed should germinate in 10-14 days. The first year it is very important to hand pick the weeds and not to use any weed killer. The high country has lots of noxious weeds that like disturbed soil, like the Field Pennycress and False Chamomile (crazy daisies.) These plants steal precious water from the germinating seeds.

We recommend that 2VS comes out and manually pull the weeds in the spring to fall. The hydro-seeded area must be watered at least 3x a week from the install date for the first month. If you have an irrigation system that it is automated, we can ensure the system is getting water to the area. We offer hand watering and recommend this service during the spring & fall. Please consider protecting your investment with 2V'S Inc.

Sincerely,

2V's Landscape & Irrigation
